Approvals ---

Characteristics and typical applications CARBO 4122 B is a basic coated electrode for plating and joining equal and similar ferritic Cr-steels and cast steels. Proper weldings are subject to the recommended heat treatment.
The electrode is specially suitable for sealing surfaces on water-, steam- and gas-valves for working temperatures up to 475 °C.
The deposit is scale resistant up to 800°C and can be tempered.

Operating temperature Room temperature up to 500° C

Base materials 1.4122 X35CrMo17

Recommendations for fabrication Since ferritic steels tend to embrittlement caused by coarse grain development the heat input should be as low as possible.
For hardfacing on low alloyed base materials a preheating of 150°C-350°C subject to the thickness (on materials with higher strength 350°C) should be done.
Post weld treatment is not necessary but quench hardening to the desired hardness may be applied.
